

Prove one workflow before widening the route.

A proposed 90-day, founder-led evaluation around the same Apache-2.0 core. Begin with fit and scope; a shorter evaluation may come first.

Who this is for

A platform or engineering lead adopting Codex or Claude Code under company provider accounts, with a named operator, policy owner, and security reviewer. This is the initial buyer hypothesis, not validated market demand.

Prerequisites

One non-production workflow; authorized provider and identity accounts; unique identities; approved test inputs; a safe access method; agreed evidence/retention boundaries; and written acceptance criteria. Timing begins after scope, prerequisites, capacity, and terms are agreed.

Phase	Work	Deliverable
Days 1–15 Map	Identify client, identity, provider, policy, secret, budget and evidence boundaries.	Control map and acceptance plan; stop or rescope if fit is poor.
Days 16–45 Prove	Configure and exercise the bounded non-production route.	Versioned evidence pack, reproducible walkthrough, and issue log.
Days 46–90 Decide	Review friction, operating effort, agreed operational checks and remaining gates.	Go/no-go memo, named gap owners, and handoff.

Agree the acceptance test

The pinned client works; a forbidden request makes no upstream call; agreed model/secret/budget policies behave as expected; identity and policy are attributable; exported evidence excludes prompt/response bodies and credentials; the operator can reproduce the checks; remaining gaps have owners.

Latency, throughput, availability, RPO/RTO, billing accuracy, and business-value targets require separate agreement and measurement. Public demo timings and internal repeatability runs are not evidence for those goals.

Keep ownership explicit.

Customer owns	Assistance, only as scoped
Hosting, TLS/ingress, access, patching, backup, metadata retention.	Configuration review and bounded integration help.
Provider charges and authorization; credential custody; JWT issuance/refresh; unique identities.	Guidance without custody of customer secrets by default.
Policy decisions, acceptable use, and approved test data.	Mapping requirements to implemented controls.
Evidence access, sharing approval, security risk acceptance and production qualification.	Content-free test results, open-gap review and handoff.

Not included or established

Managed hosting; fleet-wide coverage; client-side shell/MCP governance; 24/7 on-call; certification; legal/compliance determinations; comprehensive semantic DLP; per-inference human approval; native Hormuz login/refresh sessions; invoice reconciliation; guaranteed savings; or future portfolio features.

Price and terms

The 90-day pilot is \$15,000 USD for one team and one workflow. Provider usage, infrastructure, and applicable taxes are additional. No automatic renewal. Enterprise support starts at \$2,000 USD/month under a separate agreement.

Agree scope, availability, and payment schedule before paying; dates; time budget; meeting cadence; support hours/time zone and response targets; named contact; customer prerequisites; acceptance; change control; confidentiality; approved access/data handling; liability; termination; and post-pilot support. Obtain appropriate contract review. No default SLA is implied.

Protect sensitive information

Do not send tokens, raw prompts, customer content, production databases, or full configurations through the marketing form or public issues. Private access requires an approved method, minimal privilege, and a written handling scope.

The next decision

Stop and retain the lessons; continue self-service; resolve specific gaps in another bounded engagement; or propose a wider deployment after its gates are satisfied. Expansion is not automatic.
